

# How to open .ipynb files

An IPYNB file is a notebook document used by Jupyter Notebook, the software that we will be using during this course. These files cannot open directly by double clicking. Instead, you will have to launch the Jupyter Notebook software first. The following steps show how to run this type of file on your machine:

1. Download the file or know the exact location of the file on your machine.

2. After the file is downloaded, launch the Jupyter Notebook software. On the homepage, there will be a list of folders like Desktop, Documents, Downloads, etc. Locate the folder by double clicking on it. You can further go into subfolders.

- After reaching the destination folder, select the file from the list. You can also sort the files from the top right corner on various parameters like name, last modified and size.

Files Running Clusters

Select items to perform actions on them.
